LangChain

LangGraph

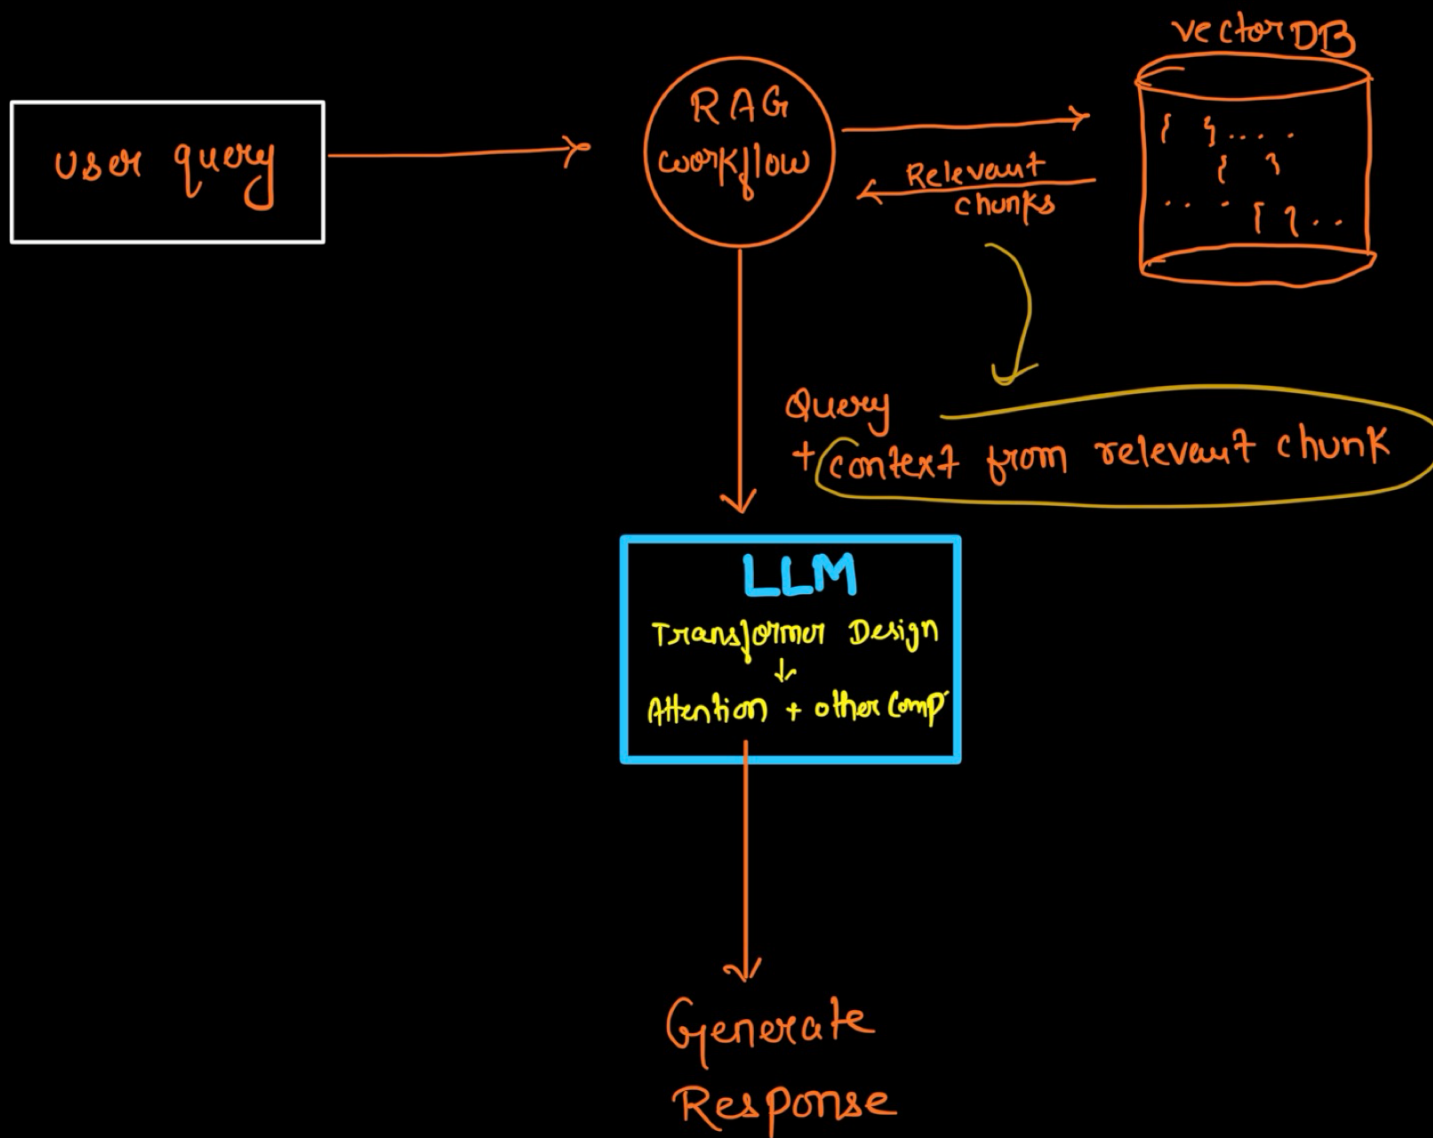

Chains & Sequences

VS

Graphs & Agents

What is LangChain

→ Framework to build applications around LLMs.
(pre-made) template

what's the weather
in my location?

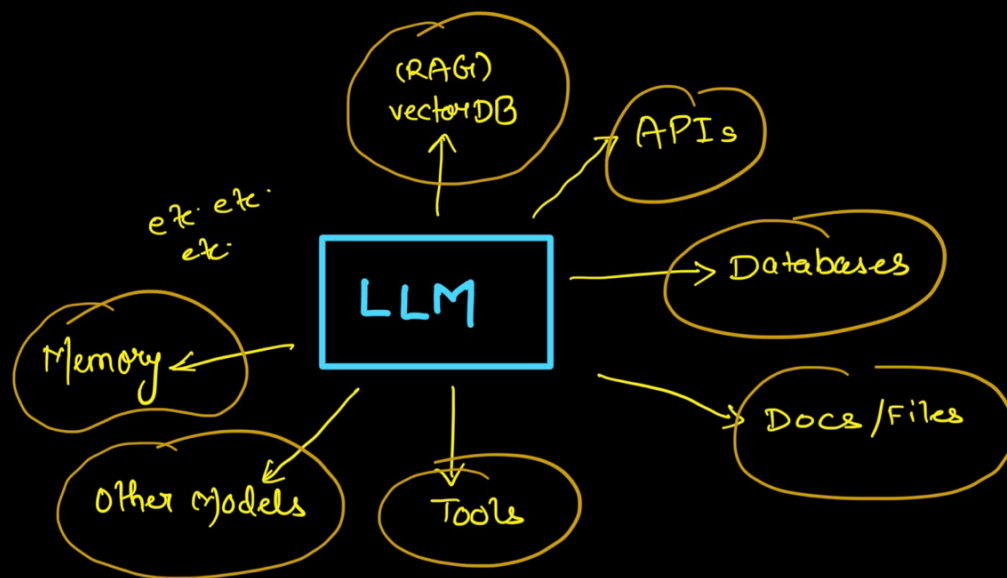

Needs access to location service
+ weather API etc.

1.) LangChain provides building blocks for creating
such applications. need to write from

such applications.

(.) Gives reusable components → No need to write from scratch.

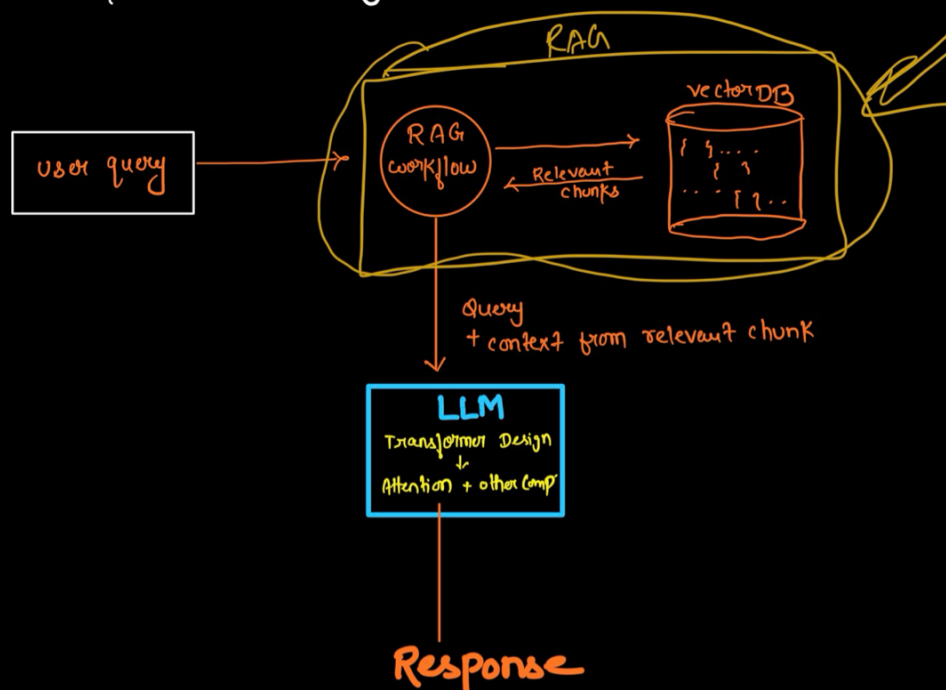

LangChain $\neq$ LLM

Langchain & RAG

(where does LangChain fit with RAG?)

No need to build from scratch.

RAG - technique/architecture

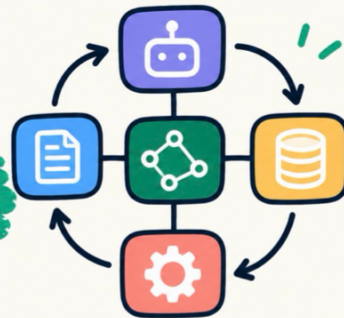

LangChain - helps to implement it easily/efficiently.

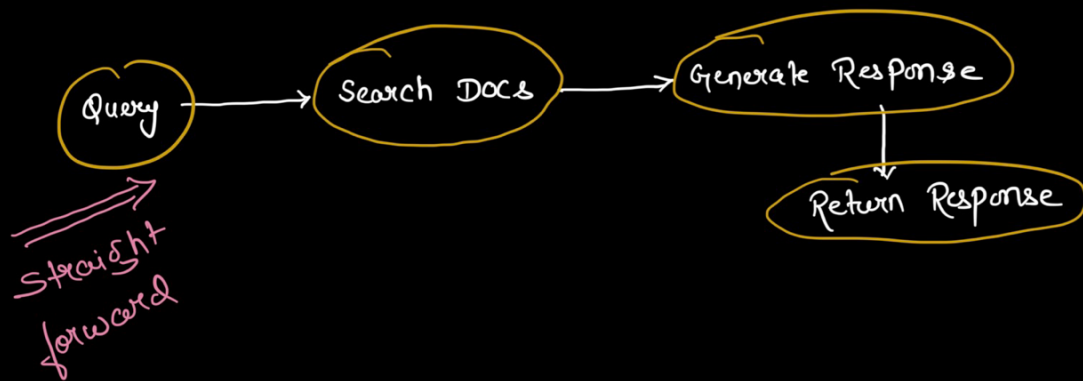

Good News: We will do practicals
with LangChain in
AI Advanced Playlist

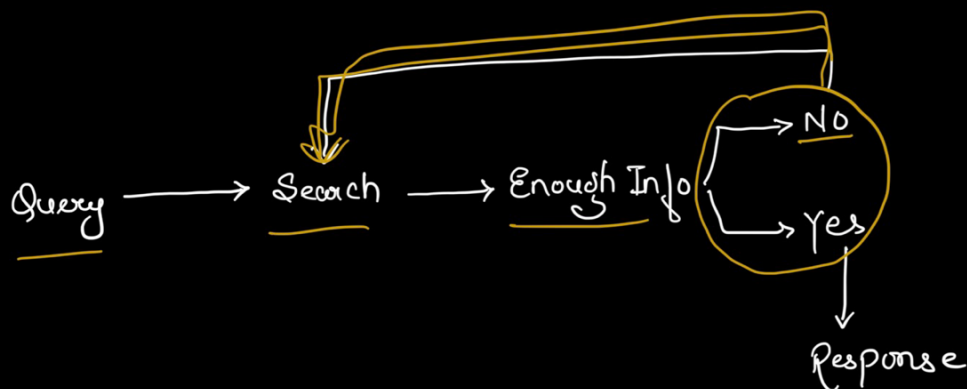

What is
LangGraph

* Building more complex, multi-step AI agents.

What if your AI agent needs to make decisions and go back and forth ???

~~Straight
Forward~~

- Decisions
- Loops ✓
- Multiple steps / paths
etc.

That's where LangGraph comes to rescue.

Why LangGraph ?

AI workflow $\approx$ Graph

Nodes — what our workflow does

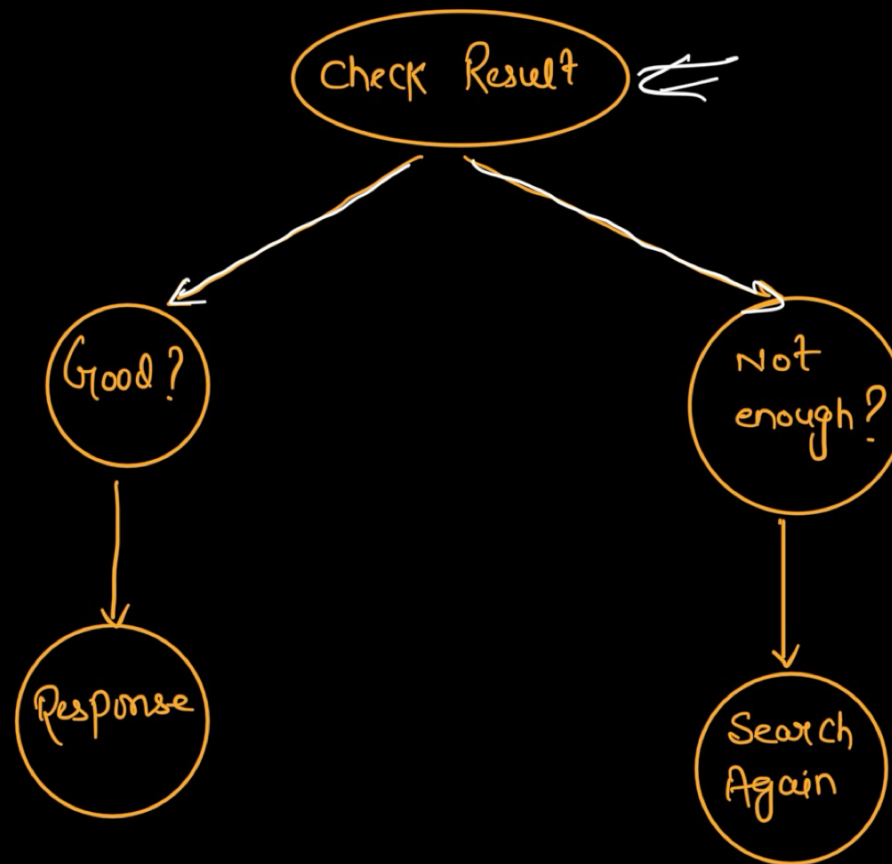

Search

Call
API

check
result

Edges — Connection between nodes

LangChain

- Building blocks for LLM applications

↳ Retriever
↳ Tools
↳ Document Loaders
↳ vector stores
etc.

LangGraph

- complex workflows involving

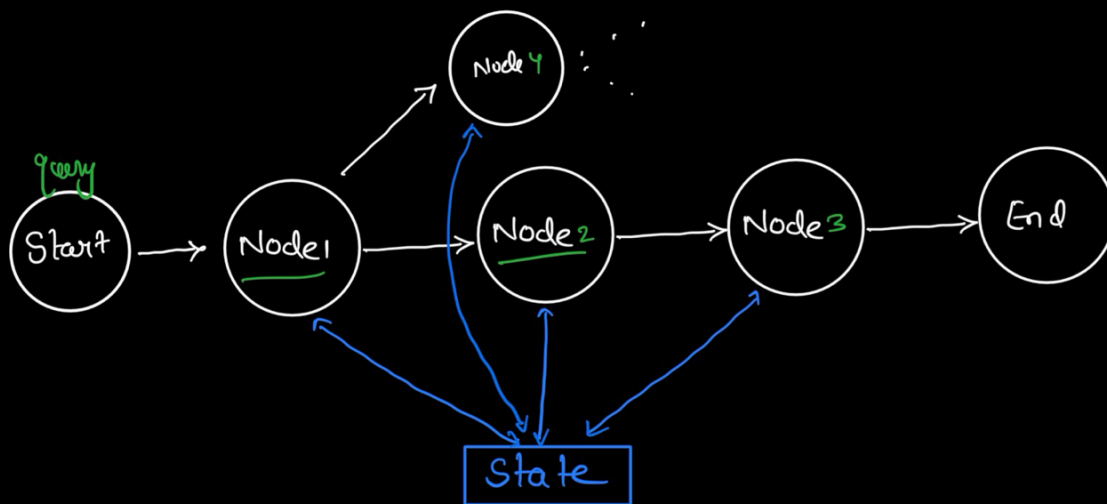

Did LangGraph

Replace LangChain?

- Not Exactly ↙
- They are related. ↙
- LangGraph can use Langchain components
and help build a complex workflow.

What is -

① "State" in LangGraph ?

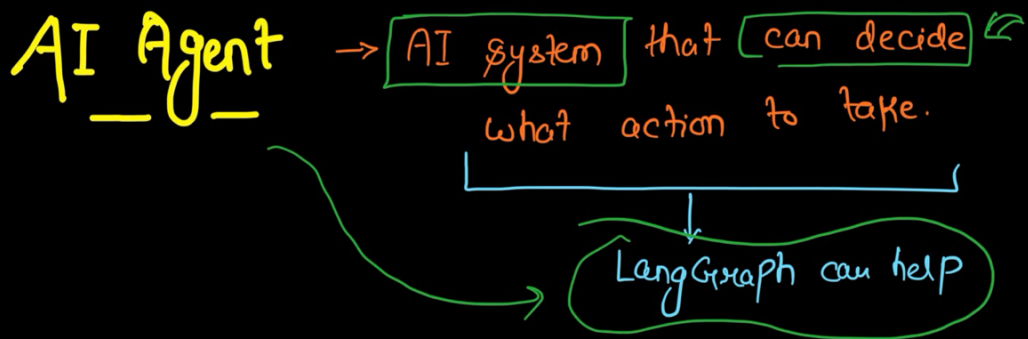

Shared Data Structure to
store current snapshot/memory
of the workflow.

LangGraph = Sequence + Looping + Decisions + State + Branching
↓
with LangChain Components

② "Chain" in LangChain -

Sequence of operations
chained together.
